

Abstract

5 A carton and blank for forming a carton of the top gripping type for accommodating a plurality of containers. The carton is tubular in structure and has top and base spaced, opposed panels. The base panel has apertures each for receiving a container. The base panel also has a foldable retaining tab hingedly connected thereto for operatively engaging part of the respective container. The carton also has a retaining structure depending from the top panel. The retaining structure comprises an engagement panel with an engaging edge to engage at least one of the containers.
